

# Azure Stack HCI Integration

Azure Stack HCI is a hyperconverged infrastructure (HCI) solution that combines software-defined compute, storage, and networking technologies to **create a unified and highly scalable infrastructure platform**. It's designed to **bring the power of Azure cloud services to your on-premises datacenter**, enabling organizations to modernize their infrastructure and operations while maintaining control over their data and applications.

Our Azure Stack HCI integration program is a **best-practice**, standard approach to assist you defining and implementing your Azure Stack HCI environment. Using our standard approach with **automated hardware configuration** and **automation scripts** for Azure integration we strive to make the Azure Stack HCI integration as smooth as possible.

Advise for automated configuration and deployment of the appliance and resource bridge

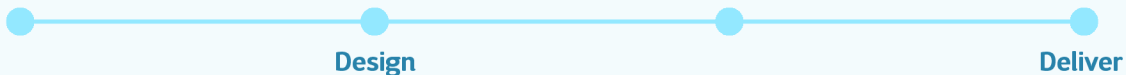

Onboarding of the appliance into Azure Arc
