

# Azure Virtual Desktop Integration

Azure Virtual Desktop is a cloud-based virtual desktop infrastructure (VDI) service which allows organizations to **create and manage virtualized desktop environments** in the Azure cloud, which users can access remotely from a variety of devices

The Azure Virtual Desktop integration program offers a **best-practice, standardized approach** to help you define and implement your Azure Virtual Desktop environment with precision. Whether you are new to virtual desktop infrastructure or a seasoned professional, this program provides comprehensive **guidance and resources** that streamline every step of the process, ensuring a seamless setup tailored to your specific requirements.

With Bicep or Terraform automation packs we provide **full control and configuration compliancy**.

Each deployment will have the ability to deploy one workspace environment with a **flexible** amount of host pools and session hosts underneath.
